Operand types:

**REG:** AX, BX, CX, DX, AH, AL, BL, BH, CH, CL, DH, DL, DI, SI, BP, SP.

**SREG:** DS, ES, SS, and only as second operand: CS.

**memory:** [BX], [BX+SI+7], variable, etc...(see [Memory Access](#)).

**immediate:** 5, -24, 3Fh, 10001101b, etc...

Notes:

- When two operands are required for an instruction they are separated by comma. For example:

REG, memory

- When there are two operands, both operands must have the same size (except shift and rotate instructions). For example:

AL, DL

DX, AX

m1 DB ?

AL, m1

m2 DW ?

AX, m2

- Some instructions allow several operand combinations. For example:

memory, immediate

REG, immediate

memory, REG

REG, SREG

- Some examples contain macros, so it is advisable to use **Shift + F8** hot key to *Step Over* (to make macro code execute at maximum speed set **step delay** to zero), otherwise emulator will step through each instruction of a macro. Here is an example that uses PRINTN macro:

```
include 'emu8086.inc'
ORG 100h
MOV AL, 1
MOV BL, 2
PRINTN 'Hello World!' ; macro.
MOV CL, 3
PRINTN 'Welcome!' ; macro.
RET
```

These marks are used to show the state of the flags:

**1** - instruction sets this flag to **1**.

**0** - instruction sets this flag to **0**.

**r** - flag value depends on result of the instruction.

**?** - flag value is undefined (maybe **1** or **0**).

**Some instructions generate exactly the same machine code, so disassembler may have a problem decoding to your original code. This is especially important for Conditional Jump instructions (see "[Program Flow Control](#)" in Tutorials for more information).**

Copy operand2 to operand1.

The MOV instruction cannot:

- set the value of the CS and IP registers.
- copy value of one segment register to another segment register (should copy to general register first).
- copy immediate value to segment register (should copy to general register first).

Algorithm:

operand1 = operand2

Example:

```
ORG 100h
```

```
MOV AX, 0B800h ; set AX = B800h (VGA memory).
```

```
MOV DS, AX ; copy value of AX to DS.
```

```
MOV CL, 'A' ; CL = 41h (ASCII code).
```

```
MOV CH, 01011111b ; CL = color attribute.
```

```
MOV BX, 15Eh ; BX = position on screen.
```

```
MOV [BX], CX ; w.[0B800h:015Eh] = CX.
